# Lesson Billions and Billions 76 Avogadro's Number 

 Avogadro's Number}
$\qquad$
Date $\qquad$ Period $\qquad$

## Purpose

To find the relationship between mass and number of atoms.

## Analysis

I. The table on the next page shows the mass of different numbers of atoms of zinc, aluminum, and iron. Complete the table.
2. What is scientific notation?
3. Why do you think scientists use scientific notation?
4. What are two ways of writing the smallest number in the table? What does it represent?
5. What are two ways of writing the largest number in the table? What does it represent?
6. Which has the most mass, 1 trillion atoms of zinc, 100 trillion atoms of iron, or 500 trillion atoms of aluminum? Explain how you can tell.
7. How many zinc atoms are there in 65.4 g ?
8. Some of the numbers in scientific notation have a negative exponent, and some have a positive exponent. Explain the difference between these two types of numbers.
9. What do 65.4 g of zinc, 27.0 g of aluminum, and 55.8 g of iron have in common?
10. What name do chemists give to a collection of 602 sextillion objects?
